

Cross-page Observatory Study

The study examines three observatories: Aster, Birch, and Cedar. On 18 April 2024, the Birch marker moved 12 m east. Figure 1 links the old and new positions with an arrow.

Aster did not move; Cedar only changed its sensor. Every Birch value in the table on page 2 refers to the new position, so the table must be interpreted with this page's text, figure, and caption.

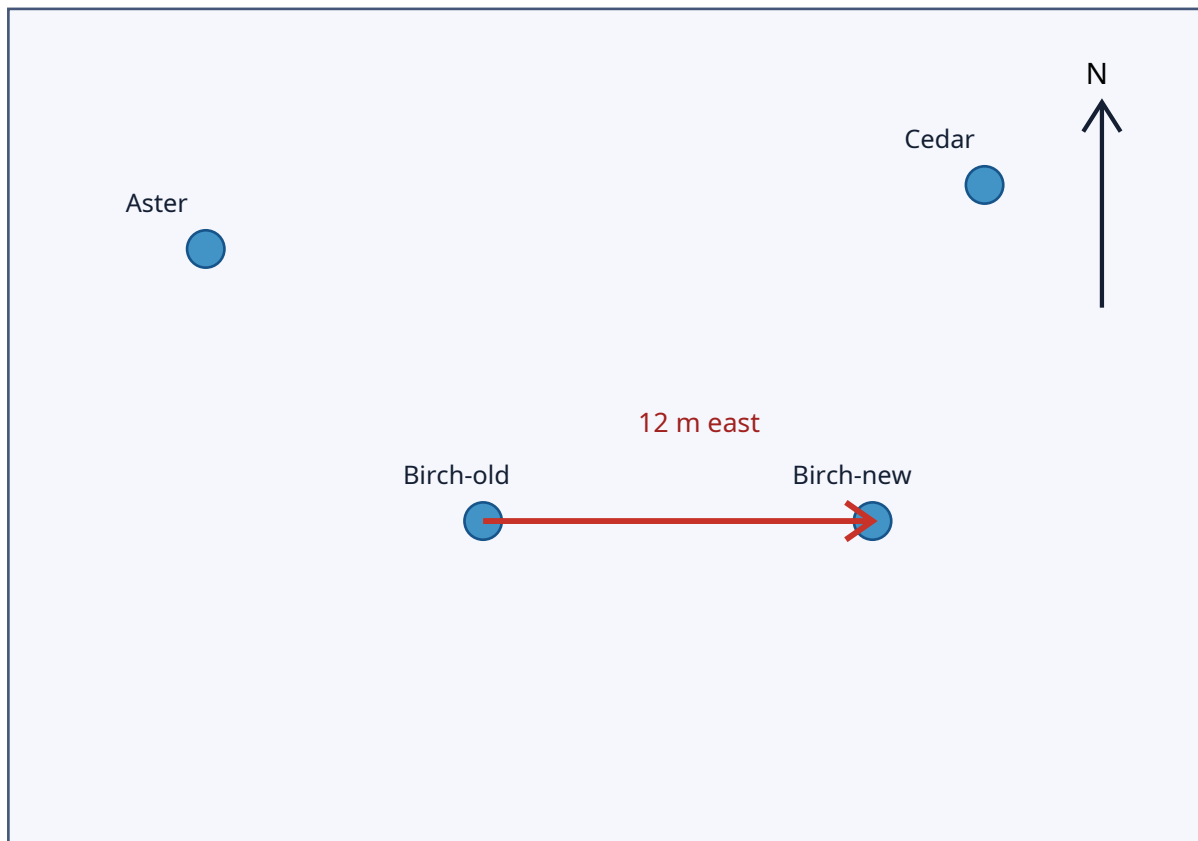

Figure 1. Birch moved 12 m east; Aster did not move, and Cedar only changed its sensor.

Observatory readings and position status

Site	Position status	Readings (°C)		Change	Notes
		Morning	Afternoon		
Aster	Not moved	18.4	18.1	-0.3	Stable
Birch	After Figure 1 move	21.6	24.8	+3.2†	New position
Cedar	Sensor changed	19.7	20.1	+0.4	Position unchanged

† Birch's +3.2 applies only to the new position after the 12 m eastward move shown in Figure 1.

If the position change in Figure 1 on page 1 is ignored, the Birch row will be assigned to the old position. The table therefore requires the preceding text, figure, and caption.
